Gnome

User Testing Report

Test Details

Field	Value
Test date	28 January 2026
Tester	Carlos M.
Device	iPhone 15 Pro – iOS 18.2
App version	0.1 (internal build, not released)
Duration	Approximately 45 minutes

Executive Summary

Carlos tested the app for close to an hour on an iPhone 15 Pro. The overall experience was positive: the map loads quickly, the markers are clear, and the gallery scrolls smoothly. However, **9 issues were identified** (2 high, 3 medium, 4 low) that should be addressed before the app is considered ready for a wider release.

Severity Summary

High	Medium	Low
2	3	4

Issues Overview

ID	Severity	Area	Issue
ERR-01	High	**Gallery**	Gallery displays 64 slots but only 60 gnomes exist
ERR-02	High	**Data**	Photos and app state are lost when the app is closed
ERR-03	Medium	**Map**	Closely-spaced markers overlap and are hard to tap
ERR-04	Medium	**Sheets**	Fixed 0.3 s delay before opening ImagePicker can fail
ERR-05	Medium	**Gallery**	Tapping an empty Gallery slot opens the picker without context
ERR-06	Low	**Gallery**	Internal Gallery detail sheet lacks Favourite and Remove options
ERR-07	Low	**Map**	Gnome of the Day is always gnome #1
ERR-08	Low	**General**	Stats and Settings screens are empty placeholders
ERR-09	Low	**Map**	Share button does nothing

Issue Details

ERR-01 – Gallery displays 64 slots but only 60 gnomes exist

Description: GalleryView iterates ForEach(1...64), yet the gnome data array contains only 60 entries. Slots 61–64 always render as empty grey rectangles that offer no useful interaction when tapped.

Suggestion: Change the range to ForEach(1...60), or — preferably — iterate directly over the gnome array received as a parameter so the grid always stays in sync with the data.

ERR-02 – Photos and app state are lost when the app is closed

Description: All state (gnomeImages, completedGnomes, favourites) lives in @State properties inside ContentView. There is no persistence layer — no writes to disk, no UserDefaults. Closing and re-launching Gnome wipes every saved photo and every favourite.

Suggestion: Add a persistence layer using FileManager or a lightweight database such as SwiftData. Serialise images as PNG files and sets/dictionaries as JSON.

ERR-03 – Closely-spaced markers overlap and are hard to tap

Description: Several gnomes share coordinates fewer than 30 metres apart (e.g. #1, #2, #3). At the default zoom level their circles overlap almost completely, making it impossible to select the marker underneath without zooming in first.

Suggestion: Introduce a clustering mechanism (e.g. MKClusterAnnotation) or a disambiguation popover that lists the nearby gnomes when a dense area is tapped.

ERR-04 – Fixed 0.3 s delay before opening ImagePicker can fail

Description: In several places (GnomeDetailView, GalleryDetailView, DescriptionSheet) the code uses DispatchQueue.main.asyncAfter(deadline: .now() + 0.3) to give the previous sheet time to dismiss before the ImagePicker is presented. On slower devices or under load the animation may not have finished, causing the picker to appear incorrectly or not at all.

Suggestion: Replace the hard-coded delay with an event-driven approach — for example trigger the next sheet inside an .onDisappear modifier or a withAnimation completion handler, so it fires only after the previous sheet has actually left the screen.

ERR-05 – Tapping an empty Gallery slot opens the picker without context

Description: When an empty slot is tapped, GalleryView calls onReplace immediately, launching the ImagePicker without first showing the gnome's name or description. This is inconsistent with the Map flow, where the description sheet always appears before the photo is requested.

Suggestion: Unify the flow: always show the gnome's description first (name + explanation), and offer the 'Add Photo' button from there — exactly as the Map tab does.

ERR-06 – Internal Gallery detail sheet lacks Favourite and Remove options

Description: GalleryView's own GnomeDetailSheetView only provides 'Open Gallery' (to replace the photo) and 'Cancel'. There is no way to favourite or delete the gnome from this sheet, creating an inconsistent experience compared with the detail view accessible from the Map.

Suggestion: Add Favourite and Remove buttons to GnomeDetailSheetView, or consolidate all detail views into a single reusable component shared across the Map and Gallery.

ERR-07 – Gnome of the Day is always gnome #1

Description: gnomeOfTheDayID is initialised as @State private var gnomeOfTheDayID: Int = 1 and is never reassigned during the app's lifecycle. The 'Gnome of the Day' banner therefore always highlights Papa Gnome (#1).

Suggestion: Set the value to Int.random(in: 1...60) on app launch, or recalculate it each time the calendar date changes so users see a different gnome every day.

ERR-08 – Stats and Settings screens are empty placeholders

Description: The Stats (chart.pie.fill) and Settings (gearshape) toolbar buttons open sheets that display nothing but a 'coming soon' message. No functionality has been implemented behind either screen.

Suggestion: Implement at least a basic stats screen (e.g. percentage of gnomes collected, number of favourites) and a minimal settings screen (e.g. dark/light mode toggle — the code already has preferredColorSchemeOverride but no UI to control it).

ERR-09 – Share button does nothing

Description: A @State property showShareSheetForID exists, but the sheet it presents contains only the text 'Sharing not available'. There is no real mechanism to share a gnome's photo.

Suggestion: Wire up UIActivityViewController so users can share a gnome's photo together with its name and number.

Positive Observations

- The map loads very quickly and the red/green markers make it immediately obvious which gnomes have already been photographed.
- Searching by name or by number (#id) on the Map tab is responsive and feels snappy.
- The intro video screen makes a strong first visual impression and immediately communicates the app's identity.
- Using sheets with presentationDetents (.medium / .large) feels very natural on iOS and keeps the user oriented without fully blocking the underlying screen.
- The Favourites feature has a clean layout, and the photo grid in the Favourites tab is visually appealing.

Conclusion and Next Steps

Gnome has a solid foundation, and the concept of collecting the Wrocław gnomes is very appealing. The high-severity issues (lack of persistence and the gallery slot mismatch) must be fixed in the first iteration. The medium-severity issues affect everyday usage and should be tackled in the second pass. Low-severity issues can be addressed in a later sprint, as they do not block normal use of the app.

It is recommended to run another round of testing with a second tester once the high and medium issues have been resolved, in order to confirm that the fixes work correctly and do not introduce new problems.
